Choosing The Right Floor

All of our wood floors are engineered which means they have a top layer or lamela which is milled from solid hardwood, this layer is bonded to a base layer of a mixture of faster growing timber. The result is a stable construction which can be installed in most interior spaces and on just about any type of subfloor including over under floor heating. At V4 we decided to stop producing purely solid floors on mass because it is wasteful and not a sustainable use of hardwood, and there is no discernible difference between a well engineered floor and a solid floor.

Engineered Plank

Plank or one strip floors are available in many different widths and lengths and are usually bevel edged to emphasise each board. Engineered Planks can be installed as floated or fully bonded floors.

Engineered Herringbone

Usually fitted with left and right blocks to form the distinctive herringbone pattern, the V4 Zigzag range has universal blocks which can be used to make different patterns. Installation is fully bonded.

Engineered Chevron

Otherwise known as French and Hungarian Herringbone, the header joints are angled at 45 or 22.5 degrees to form the distinctive chevron pattern. Installation is fully bonded to the subfloor.

Laminate Flooring

Our laminate floors are made of the highest quality high density soft-wood fibre board. The wooden surface is imprinted with images of real hardwood floors and given a tough textured coating which looks and feels like natural wood flooring.

Choosing The Right Finish

Care & Maintenance Advice

All our floors are finished to the highest level to suit the type of surface. Choosing the right finish for your needs is an important factor in choosing your perfect floor. Each finish has distinctive characteristics and may need varying degrees of care and maintenance.

UV Oil

Coats of Danish oil are buffed into the top layer and cured under UV light.

Finish: A satin sheen is added to the oiled surface of the wood.

Usage: Perfect for living rooms and bedrooms. In kitchens and dining rooms extra maintenance is recommended.

Care: Use a pH neutral spray cleaner for regular cleaning. Avoid scratches by minimizing surface dust and grit, use felt pads to protect from furniture. Wipe up any spillages quickly.

Maintenance: Initial application of Rubio Monocoat Universal Maintenance oil (use a complementary colour) after installation with periodic application thereafter which will depend on usage.

Natural Oil

Coats of Danish oil are applied and machine buffed into the top layer, impregnating the surface.

Finish: The most natural finish of any, creating a deep lustre whilst maintaining the tactile surface of the wood.

Usage: Perfect for living rooms and bedrooms.

Care: Use a pH neutral spray cleaner for regular cleaning. Avoid scratches by minimizing surface dust and grit, use felt pads to protect from furniture. Wipe up any spillages quickly.

Maintenance: Initial application of Rubio Monocoat Universal Maintenance oil (use a complementary colour) after installation with periodic application thereafter which will depend on usage.

Hardwax Oil

Coats of hardwax oil are buffed into the top layer. The high solid oil oxidizes to form a wax surface.

Finish: A rich, smooth and durable surface.

Usage: Perfect for living rooms and bedrooms. In kitchens and dining rooms extra maintenance is recommended.

Care: Use a pH neutral spray cleaner for regular cleaning. Avoid scratches by minimizing surface dust and grit, use felt pads to protect from furniture. Wipe up any spillages quickly.

Maintenance: Initial application of Ciranova Titan Hardwax oil after installation with periodic application thereafter which will depend on usage.

Lacquer

The top layer is spray coated with multiple coats of primer and then two coats of durable UV cured lacquer.

Finish: A smooth hard wearing and low maintenance surface which enhances the natural grain and beauty of the wood.

Usage: Ideal for kitchens and dining rooms where there is high risk of food and drink spills.

Care: Use a pH neutral spray cleaner for regular cleaning. Avoid scratches by minimizing surface dust and grit, use felt pads to protect from furniture. Wipe up any spillages quickly.

Maintenance: After long term use can be lightly sanded to key the lacquered surface so that an extra coat of lacquer can then be applied.

Choosing The Right Grading

V4 Wood Flooring is milled, responsibly sourced timber selected for its natural beauty, find out more about the different characteristics.

AB Select/Nature Grade

Planks are selected to give grain and colour variation. There can be a small amount of light sapwood around the edge of the board. Small sound knots and smaller filled knots also add to the natural effect.

ABC Mixed Grade

Popular in species such as walnut. This grade displays more variation in grain and colour with larger sound and filled knots with more sapwood well distributed. Expect small filled cracks and dark streaks.

CD Rustic Grade

More economical timber selection allows for more grain and colour variation with large sound knots and more filled knots well distributed. Small filled cracks and dark streaks are also apparent.

Choosing The Right Surface

The V4 Collection is comprised of many different finishes ranging from precision machined smooth sanding and modern staining processes to the hand rendered distressing and scraping done by skilled carpenters using traditional tools with centuries old techniques. Each process gives a board its individual characteristic.

Smooth

The surface is sanded flat. When this surface is oil finished the grain will be slightly raised giving slight texture, whereas lacquer will make it completely smooth to touch.

Brushed

A steel brush removes the soft grain from the surface layer creating a textured surface which enhances the beauty of the natural grain. This also allows for some interesting applications of colour.

Bevel Edged

Most floors have a bevel edge on four or two sides of the surface this is usually a 1-2mm diagonal edge which helps distinguish the planks and adds character to the floor.

Unfinished

This is a surface that has been milled and sanded smooth and any knot holes or blemishes have been filled, but the surface has not been sealed with lacquer or oil.

Stained

Stain is applied by rollers and buffed to penetrate the top surface of the board and then sealed with either oil or lacquer, resulting in extra emphasis of the natural figure of the wood.

Hand Scraped / Hand Planed

This process can only be done by hand using traditional tools to scrape out the soft grain following the natural contour of the wood. The result is a gentle undulating smooth surface.

Embossed / Deep Brushed

The soft grain is removed with up to 6 steel brushes each one with less intensity. The result is a deep textured grain.

Smoked / Fumed

Timber is stored in chambers and exposed to processes that darken and enrich the natural wood colours. This is ideal for designers where rich tonal variety is preferred.

Cross Sawn

Random saw marks are made across the grain adding extra texture to the surface in order to replicate floors of old. The result is a beautifully tactile wood floor.

Distressed

Various methods are used to give the wood an aged well used appearance also that of a board milled using rudimentary rustic tools. The skill is in making the distressing look natural.

“Large oak planks with rough hewn surfaces inspired by nature”

Crafted using extra wide engineered European oak planks. Finished by dedicated and skilled craftsmen through the use of traditional hand tools to plane and scrape the oak surface following the contours of the grain. The tool marks are left adding extra character to the flooring surface, made more prominent with muted natural colours and hardwax oil finishes.

“Reclaimed oak floors steeped in history”

Engineered boards made from oak floor boards, beams, posts and trusses salvaged from ancient agricultural buildings in the forgotten rural enclaves of Eastern Europe. Oak timber is selected and sawn into thick rough hewn top layers some showing the wear of decades whilst others are internal slices with deep stained markings that only come with the grain of aged timber.

“Reclaimed wood wall cladding”

Make a feature of your walls with the Panneau wooden wall panel collection. Made from reclaimed and recycled woods the decorative wall panels are available in a range of colours and patterns, bringing the natural beauty and texture of real wood to easy-to-install feature wall panels.

**WKFP01**

'Off-cut' strips of cured European oak which are split and cracked to form this rough hewn surface.

**WKFP02**

Ancient wine barrels are dismantled and recycled for this amazing surface.

**WKFP03**

Reclaimed chestnut from dusty old agricultural buildings. The rough sawn pieces are interspersed with carved sections of architrave.

**WKFP24**

Hand selected off-cut pieces of pine are flamed to produce a distinctive scorched surface which accentuates the natural grain.

**WKFP29 | Black Walnut**

Made from randomised black high density wooden blocks faced with a fine grade American Black Walnut.

**WKFP04 | Artisan**

Thermo treated chunks of Eucalyptus wood are given a deep burnished earth tone, accentuated by the split rough surface.

Peel & Stick

“Beautifully simple solid wood walls”

Easy-to-install solid wood wall panels can be cut to any size or installed straight from the box with unrivalled simplicity. These versatile pine planks come in a range of colours and finishes which can be installed together to create stand-out feature walls in just about any interior space.

“Solid oak profiles to match and finish off your perfect floor”

Complete your installation with our range of profile bars, beading, nosing, adhesives and underlay. Here are just some of the accessories we offer, for a full range visit our website or ask your V4 Approved Supplier for more information.

Solid Oak Ramp Edge

A solid hardwood profile, fixed to the sub floor which allows for expansion where there is a transition in floor level.

Solid Oak T-Bar

A solid hardwood profile, fixed to the sub floor to cover an expansion gap between two sections of hardwood flooring.

Solid Oak Square Edge

A solid hardwood edging profile fixed to the sub floor to allow for expansion where a floor meets an obstruction such as a wall or fire hearth.

Solid Oak Wood-To-Carpet/ Wood-To-Tile

A solid hardwood profile fixed to the sub floor to allow for expansion where there is transition from wood floor to carpet or tiled surface.

Solid Oak Flush Fit Stair Nose

A solid hardwood profile designed to give a hard wearing edge to a step. Tongue & Grooved to connect into V4 Wood Flooring.

Scotia Beading

Edging strip to cover expansion gap around the edge of a room.

Installation Essentials

Wood's Good® Ecogold

Designed to support and cushion wood flooring this amazing underlay is made from recycled car tyres. The insulating gold foil vapour barrier protects against the possibility of rising moisture.

Wood's Good® Timbermax UFH

This lightweight underlay provides support and cushions the floor whilst its perforated foam gives optimum performance with underfloor heating. Includes Vapour barrier.

Mapei Adhesive D3 PVAC

Solvent-free, water-resistant vinyl adhesive for floating floors in pre-finishes, wood or rigid, melamine and laminated amino-plastic.

ULTRABOND ECO S940 1K

Solvent-free, silylated polymer-based adhesive with very low VOC emission level for bonding solid wooden floors or pre-finished multi-layered wooden floors of all types and formats.

Mapei Ultraplan Renovation Screed

Fibre reinforced self levelling compound, designed for use in the refurbishment of existing floors in both commercial and domestic applications.

Mapeproof ESM (Liquid Damp Proofing)

Two-component, solvent-free, one or two coat pure epoxy resin, used as a moisture barrier on cement based substrates

Care & Maintenance

“Everything you need to clean and protect your floor”

Make sure your floor stays in great condition with our range of everyday cleaners and maintenance products

Bona Spray Mop Kit

Bona premium floor mops are durable and easy to use. The Wood Floor Spray Mop enables you to clean and maintain your wood floor in a sweep.

Bona Spray Kit Refills

850 ml Refill bottles available in 3 varieties: Wood Floor Cleaner (for all wood floors); Oiled Floor Cleaner; and Laminate and Stone Floor Cleaner.

Bona Wood Floor Cleaner Large Refill

2.5 Lt Refill Bottle available in 3 varieties: Wood Floor Cleaner (for all wood floors); Oiled Floor Cleaner; and Laminate and Stone Floor Cleaner.

Rubio Monocoat Universal Maintenance Oil

Available in complementary colours to suit your floor, Universal maintenance oil used for protecting and refreshing the colour of oiled wooden

Ciranova Titan Hardwax Oil

Special hardwax oil suitable for finishing unfinished wood and refinishing natural oiled and hardwax oiled wooden floors. Good filling properties, very natural colour.

Loba Lacquer Finishes

Water based lacquers available in different sheens for finishing and refinishing and staining hardwood floors.

Before Your Flooring is Delivered

There are a few important checks to make if you want to begin installing right away.

1. Complete all wet trades

Wet trades MUST be complete and fully dried, this includes floor screeds and any plastering or rendering. It is important to carry out a relative humidity test or RH test.

2. Complete main decorating

Ideally all other work except some secondary decoration to skirting and architraves should be completed. This will help prevent any damage to the floor. Decorating dust and paint spills are one of the most common causes of damage to freshly laid wood floors, so where possible it is a good practice to complete and clean any sanding. Paint walls and ceilings and limit the risk of any paint spills. Skirting and architrave may have to be completed after the install and tape can be used to mask the floor. **Important:** Beware of leaving masking tape on the floor for longer than is necessary to complete each coat, tape should be removed between each coat and not left for longer than a day, this is especially important if the floors are heated. **Important:** Avoid covering the floor with non-breathable 'protective' sheeting, which if left on the floor, can cause condensation which in turn will damage the floor.

3. Complete kitchen or fitted furniture installation

Where possible any fixed furniture such as a kitchen unit should be installed prior to installing your wood floor. This is recommended for two reasons, the first being the most obvious that it will limit the risk of accidental damage to the floor caused during the kitchen installation. It is important not to cover the floor for extended periods. The second reason not to install heavy fixed units over your floor, is to avoid 'pinning' the floor down. A kitchen unit with appliances and a heavy worktop can be very heavy. A heavy load can stop the floor from expanding and contracting evenly. At best this can cause the floor to gap at walls or creak, at worst it can cause the floor to fill an expansion gap and lift off the subfloor completely, even causing structural damage. Kitchen units can be installed first with kick boards adjusted and provisional gaps made in end panels and plinths to slide the floor underneath.

4. Subfloor Check

Most importantly the subfloor, the floor on which your flooring is being installed should be fully prepared. It must be structurally supportive and free from any defective movement so that footfall does not cause the floor to move. Exposed joists should be covered with load bearing plywood, OSB or flooring grade chipboard. Floorboards should be fully secured. Concrete screeds and levelling compounds must be fully cured and moisture checked. **If levelling is required on a wooden suspended floor** or floorboards, this can be achieved by relaying a suspended wooden floor and correcting levels under the structural layer. Or in some cases a layer of flexible fibre based levelling compound may be added. **If levelling is required for a screeded floor**, raised areas can be removed and or levelling compound can be used. **If the subfloor is a combination of screed and suspended floors then it should be equalised** with the addition of a fully bonded layer of 6 - 21mm plywood. If it cannot be covered like this then a provision for expansion joints should be used where two different surfaces meet. Transition profiles can be used to separate the two areas of wood flooring.

5. Underfloor Heating (UFH)

If flooring is being installed over an underfloor heating system, then where possible the UFH should be within a screed or self levelling compound with direct contact to the floor via a flexible adhesive. DO NOT use the UFH system to accelerate a screed's drying time as this can lead to a weakness in the subfloor. The UFH system must be fully commissioned before installation and in use over a period of two weeks to test for any defects, leaks etc... The UFH system must be turned off 48hrs prior to the installation. **IMPORTANT:** The surface of the installed wood floor must not exceed 27°C.

6. Final Checks

Importantly all these areas should be checked and tests should be carried out by the installer, RH reading should be taken and moisture checks made on the subfloor. (Visit v4woodflooring.co.uk for details.)

7. Once Your Flooring Arrives

Your flooring should be carefully placed in the room it is to be installed in. The packs can be very heavy and easily damaged. Stack the packs and leave in situ for at least 72 hrs. The packs are not airtight and should not be opened during this time as the wood acclimates to your home or the site conditions. Once opened you may find that the planks can bow slightly and this is fairly common but should not cause an issue once they are installed in a random staggered pattern.

Once Your Flooring Installation is Complete

Before you use the room

Before moving furniture in you should allow 24 hrs for the floor to settle. If joints were bonded with PVAC adhesive for a floated installation or if the floor was fully bonded to the subfloor with an MS adhesive both will be fully cured in 24 hrs. If your floor was secret nailed to the subfloor or it was a floated click/locking floor it should still be left for 24 hrs.

Commissioning Oiled Floors

With all types of oiled floor it may be wise to commission the surface with a coat of maintenance oil. This is especially important for oiled floors in high traffic areas such as kitchens or rooms with outside doors. This coat is usually applied by buffing machine which will heat up the surface of the floor and redistribute the existing oils and waxes in the pores of the wood making it far easier to maintain in the future.

Floor Care Tips

All V4 Wood Flooring has a domestic guarantee of 35 years and if properly cared for your floor will last for generations. The following tips will help you get the most from your wooden floors.

1. Ambient Conditions

During the life of the floor ambient humidity must be maintained within the range of 45% to 65% RH and 18 to 24°C. This includes during periods when the property is unoccupied such as during holidays. Please note that high humidity may lead to warping and other issues, whilst excessive drying caused by high temperature &/or low humidity may lead to splits and warping. Avoid rapid changes in temperature.

2. Entrance Mats

Always have internal and external entrance matting at all entrances to the property; this will help prevent abrasive particles being carried onto the floor, and will extend the life of the floor finish. It is a good idea to fit mat wells so that the mat itself does not damage the floor.

3. Protect From Furniture

Use self-adhesive felt pads on flat furniture feet to protect the floor from excessive scratching, and use felt based castor cups under wheeled furniture. A purpose made polypropylene floor mat must be used below wheeled office chairs. [Note: Heavy scratching will break the seal of the lacquer causing damage to the timber by ingress of dirt and moisture from cleaning.] Felt pads also give an added advantage of making heavy furniture easier to move.

4. Household Plants

A) Take care when watering not to spill water around the base of any planter and avoid using metal trays as these can react with water and the natural tannins in oak to produce black watermarks.

B) A planter with soil soaked in water can cause the underside to be cold which can lead to condensation, so it is a good idea to use protective non-reactive plastic mats beneath pots and trays.

5. Foot Traffic

Stiletto heels may damage wood floor finish and cause compression marks on some wood species, and are not recommended for use on wood floor. Avoid heavy work boots with abrasive soles and thick treads which can retain abrasive objects such as gravel stones. In areas of high foot traffic pay special attention to daily cleaning and where possible use protective rugs and matting.

6. Pet Care

A) Keep pets' claws well trimmed to avoid scratches and protect areas where they sleep and feed to avoid damage from moisture and spills. **B)** Always protect flooring around your pet's food and water bowls from spills and standing water.

7. Sunshine

Wood is a natural material and is affected by UV light. As with the blackened oak beams of ancient houses all wood will mellow and change colour with sunlight. Oak will mellow and become darker and richer in tone whilst the grey brown of American Black Walnut will turn a more golden hue. Each species will react in different ways to UV light. In rooms with large windows, especially those which are south facing, special care should be taken to reposition furniture and rugs to ensure an even colour across the floor. Floors treated with stains and lyes are more stable in strong UV conditions.

8. Clean Up Spills

Avoid standing water or liquid. Mop up any liquid spills quickly and never allow spills to stay on the surface for any length of time. If moisture ingresses into the surface of your floor it may cause lasting damage.

9. Protection Whilst Decorating

A) When protecting your floor, where possible avoid covering with plastic sheeting or any material which does not breathe as it can form condensation. Instead use card or fabric dust sheeting.

B) When using masking tape to paint round architrave and skirting, **DO NOT** leave tape on the floor longer than it takes to paint each coat. If left for more than a couple of hours, tape adhesive can react with the floor finish causing damage. **C)** If paint is spilled remember that cleaning fluids may damage the floor so avoid if possible, instead use mild soap and a nylon brush to work away the paint.

10. Regular Cleaning

Daily/weekly cleaning consists of sweeping with a soft broom or dust-attracting flat head mop. Floors can be periodically cleaned with an almost dry wrung out mop, avoiding use of excess moisture. **NEVER WET MOP OR STEAM CLEAN WOODEN FLOORS.** All spills should be wiped up immediately with an absorbent kitchen towel. **Avoid** abrasive micro fibre cloths and wet wipes, which can react with the lacquer or oil and remove the finish.
